

Species Cross-Reactivity of AbraMag GAH

AbraMag Goat anti-Human IgG (GAH) beads do not cross-react with other species' IgG. Sandwich ELISA (in which microplate wells were coated with the GAH antibody) was used to measure binding of different species' IgG by the Goat anti-Human IgG antibody used to produce AbraMag GAH magnetic beads. Cross-reactivity was virtually zero for all species tested (bovine, horse, mouse, and rabbit).
